About the Grimeton Radio Tower

The six radio towers at Grimeton Radio Station are among the most recognizable landmarks in the history of wireless communication. Completed in 1924, the towers support the antenna system used by the Alexanderson alternator transmitter, allowing radio messages to be sent across the Atlantic Ocean.

Standing 127 meters (417 feet) tall and stretching nearly 2 kilometers (1.2 miles) across the landscape, the antenna system was a remarkable engineering achievement of its time. Together, the towers formed a vital communication link between Europe and North America long before satellites and the internet existed.

Today, the towers remain an iconic part of Grimeton Radio Station, a UNESCO World Heritage Site and the world's only preserved and operational pre-electronic transatlantic radio station.
